Usability study

Pick a task, then press Start. Time, taps and errors are logged.

1. Mark attendance with a class code — Start
2. Sign up for a point bus — Start
3. Request a gate pass for a visitor — Start
4. Open your Spring 2026 admit card — Start
5. Request a recommendation letter — Start

Task	s	Taps	Err	
Mark attendance wi	5.3	8	0	S
Sign up for a poin	21.3	11	0	S
Request a gate pas	25.2	13	0	S
Open your Spring 2	7.5	2	0	S
Request a recommen	18.1	12	0	S

Copy CSV

Test codes: 123456 works; 000000 shows the not-enrolled error.

Task	Avg time (s)	Avg taps	Total errors
1. Mark attendance with a class code	5.9	8.4	0
2. Sign up for a point bus	22.2	12.2	0
3. Request a gate pass for a visitor	42.1	17.2	6
4. Open your Spring 2026 admit card	5.2	3.6	0
5. Request a recommendation letter	19.3	11.8	1

Insights

Gate pass request varies widely

Times ranged from 22.0 s to 88.7 s. Runs 4 and 5 took 88.7 s (34 taps, 3 errors) and 50.8 s (14 taps, 2 errors). The other three runs averaged about 23.6 s with at most one error. The median time is 25.2 s, so the 42.1 s average is pulled up by two slow runs. The flow works for users who know where to go and breaks down for those who do not.

Attendance is fast and reliable

Four of five runs used exactly 8 taps, the average time was 5.9 s, and there were no errors.

Admit card entry point is not obvious to everyone

Runs 1 to 3 needed the 2-tap minimum. Runs 4 and 5 needed 6 taps and about 7 s. Run 3 also took 7.5 s with only 2 taps, which suggests hesitation before the first tap.

Bus signup and recommendation letter are long but stable

Both take 10 to 15 taps and 14 to 27 s, with one error between them. They work, but fewer steps would speed them up.

No abandoned tasks

No run was given up, so the issues found concern efficiency and discoverability, not dead ends.

Limitations

The sample size of willing participants is small but can grow.
